

Cholesterol and lifestyle

Description

Your body needs cholesterol to work well. But cholesterol levels that are too high can harm you.

Cholesterol is measured in milligrams per deciliter (mg/dL). Extra cholesterol in your blood builds up inside the walls of your blood vessels. This buildup is called plaque, or atherosclerosis. Plaque reduces or stops blood flow. This can cause a:

- Heart attack
- Stroke
- Serious heart or blood vessel disease

Your Cholesterol Numbers

All men should have their blood cholesterol levels tested every 5 years, starting at age 35. All women should do the same, starting at age 45. Many people should have their blood cholesterol levels tested at a younger age, possibly as early as age 20, if they have risk factors for heart disease. Have your cholesterol checked more often (probably every year) if you have:

- Diabetes
- Heart disease
- Blood flow problems to your feet or legs
- A history of stroke

A blood cholesterol test measures the level of total cholesterol. This includes HDL (good) cholesterol and LDL (bad) cholesterol.

Your LDL level is what health care providers watch most closely. You want it to be low. If it gets too high, you will need to treat it.

Treatment includes:

- Eating a healthy diet
- Losing weight (if you are overweight)
- Exercising

You may also need medicine to lower your cholesterol.

You want your HDL cholesterol to be high. Exercise can help raise it.

Eating Right

It is important to eat right, keep a healthy weight, and exercise, even if:

Saturated fats

Saturated fats are found in animal products such as butter, cheese, whole milk, ice cream, cream, and fatty meats, and oils such as coconut, palm, and palm kernel oil

ADAM

- You do not have heart disease or diabetes.
- Your cholesterol levels are in the normal range.

These healthy habits may help prevent future heart attacks and other health problems.

Eat foods that are low in fat. These include whole grains, fruits, and vegetables. Using low-fat toppings, sauces, and dressings will help.

Look at food labels. Avoid foods that are high in saturated fat. Eating too much of this type of fat can lead to heart disease.

- Choose lean protein foods, such as soy, fish, skinless chicken, very lean meat, and fat-free or 1% dairy products.
- Look for the words "hydrogenated", "partially hydrogenated", and "trans fats" on food labels. DO NOT eat foods with these words in the ingredients lists.
- Limit how much fried food you eat.
- Limit how many prepared baked goods (donuts, cookies, and crackers) you eat. They may contain a lot of fats that are not healthy.
- Eat fewer egg yolks, hard cheeses, whole milk, cream, ice cream, and cholesterol and lifestyle.
- Eat less fatty meat and smaller portions of meat, in general.
- Use healthy ways to cook fish, chicken, and lean meats, such as broiling, grilling, poaching, and baking.

Eat foods that are high in fiber. Good fibers to eat are oats, bran, split peas and lentils, beans (kidney, black, and navy beans), some cereals, and brown rice.

Learn how to shop for, and cook, foods that are healthy for your heart. Learn how to read food labels to choose healthy foods. Stay away from fast foods, where healthy choices can be hard to find.

Get plenty of exercise. And talk with your provider about what kinds of exercises are best for you.

Alternative Names

Hyperlipidemia - cholesterol and lifestyle; CAD - cholesterol and lifestyle; Coronary artery disease - cholesterol and lifestyle; Heart disease - cholesterol and lifestyle; Prevention - cholesterol and lifestyle; Cardiovascular disease - cholesterol and lifestyle; Peripheral artery disease - cholesterol and lifestyle; Stroke - cholesterol and lifestyle; Atherosclerosis - cholesterol and lifestyle
